EDID LEARN

The KVM is designed to learn a connected monitor's EDID upon power up. In the event of connecting a new monitor to the KVM, a power recycle is required.

The KVM will indicate the unit's EDID learn process is active by flashing the front panel's LED. The LED will flash green for approximately 10 seconds upon beginning the EDID learn. Once the LED stop flashing, the power will cycle and the EDID learn will be complete.

A monitor must be connected to the video output port located in the console space at the back of the KVM during the EDID learn process.

If the read EDID from the connected monitor is identical to the current stored EDID in the KVM then the EDID learn function will be skipped.

HARDWARE INSTALLATION

1. Ensure that power is turned off or disconnected from the unit and the computer.
2. Use a DVI cable to connect the DVI output port from the computer to the corresponding DVI-I IN port of the unit.
3. Use a USB cable (Type-A to Type-B) to connect a USB port on the computer to the respective USB ports of the unit.
4. Connect a monitor to the DVI-I OUT console port of the unit using a DVI cable.
5. Connect a USB keyboard and mouse in the two USB console ports.
6. Finally, power on the KVM by connecting a 12VDC power supply to the power connector, and then turn on the computer.

Note: The computer connected to port 1 will always be selected by default after power up.

Note: You can connect up to 1 computer to the 1 port KVM.
